PART 31 — Backtesting and Research Sandbox	33
PART 32 — Performance Feedback Loop	35
PART 33 — Investment Decision Record	35
PART 34 — The Final ChoreData Investment Engine	37
PART 35 — Master Operating Model	39
The Fundamental Logic	40

The correct approach is to rebuild the entire framework as one coherent investment operating system, rather than treating Parts 1–6 as separate documents.

The reasoning below is organized into a hierarchical structure:

Investment Philosophy → Universe → Screening → Research → Valuation → Technical Timing → Risk → Portfolio Construction → CIO Decision → Execution → Monitoring → Feedback/Backtesting.

The substantive criteria from the original framework are retained, and the AI multi-agent architecture from the redesign is incorporated.

Master Architecture

The entire system should be understood as **one investment decision pipeline**:

PART 1 — Investment Mandate and Objectives

Before analysing a stock, the system must establish **what it is trying to achieve**.

1.1 Portfolio Architecture

Investment Portfolio

70% of capital

- 10–15 stocks
- 3–5 year horizon
- Fundamentals-first
- High-quality compounders
- Margin of safety
- Technical confirmation for entry

Trading Portfolio

30% of capital

- Maximum 5 stocks
- Days-to-weeks horizon
- Technical timing
- Mean reversion
- Trend following
- Strict risk management

1.2 Investment Objectives

Target:

Metric	Objective
Annual return	15–20%
Maximum drawdown	<15%
Sharpe ratio	>1.5
Trading win rate	>60%
Minimum trading R/R	1.5:1

These are **targets**, not guaranteed outcomes.

PART 2 — Investment Universe

The initial universe consists of the 24 companies:

Ticker	Company
AMD	Advanced Micro Devices
AMZN	Amazon
ANET	Arista Networks
ASML	ASML Holding
AVGO	Broadcom
BE	Bloom Energy
CEG	Constellation Energy

Ticker	Company
CRWD	CrowdStrike
DDOG	Datadog
ECHO	EchoStar
EOSE	Eos Energy Enterprises
GOOGL	Alphabet
MDB	MongoDB
META	Meta Platforms
MRVL	Marvell Technology
MSFT	Microsoft
MU	Micron Technology
NVDA	NVIDIA
ORCL	Oracle
PLTR	Palantir Technologies
TSM	Taiwan Semiconductor Manufacturing
TSLA	Tesla
VRT	Vertiv Holdings
ZS	Zscaler

The system can subsequently expand beyond this universe.

PART 3 — Data and Research Infrastructure

The investment engine requires five major data categories.

3.1 Fundamental Data

- Income statement
- Balance sheet
- Cash-flow statement
- Segment data
- EPS
- Revenue
- FCF
- Debt
- Shares outstanding
- Dividends
- Insider ownership

3.2 Market Data

- OHLCV
- Daily prices
- Weekly prices
- 3-day prices
- Monthly prices
- Volume
- ATR
- Volatility

3.3 Alternative Data

Future implementation:

- News
- Sentiment
- Social data
- Satellite data
- Web traffic
- On-chain data

3.4 Macro Data

- GDP
- PMI
- CPI
- PPI
- Employment
- Interest rates
- Yield curve
- Consumer confidence
- Credit spreads
- Dollar
- Commodities

3.5 Options Data

- Implied volatility
- Historical volatility
- IV Rank
- IV Percentile
- Open interest
- Volume
- Put/call ratios
- Skew
- Term structure
- Expected move

PART 4 — Stage 1: Institutional Green Zone Screen

This is the **primary quantitative gate**.

The objective is not to determine whether a company is a perfect investment.

The objective is:

Identify companies that deserve deeper research.

4.1 Green Zone Scorecard

There are 20 principal criteria.

#	Criterion	Green Zone
1	Revenue growth	$\geq 10\%$ 5Y CAGR
2	Net income growth	$\geq 12\%$ 5Y CAGR
3	Operating CF growth	$\geq 12\%$ 5Y CAGR
4	Margin expansion	Consistently improving
5	ROE	$\geq 18\%$
6	ROIC	$\geq 15\%$
7	Revenue vs AR	Revenue growing faster
8	Cash conversion	OCF / NI $> 100\%$
9	Share count	Declining 1-3% annually
10	FCF/share	$> 10\%$ CAGR
11	P/FCF	Below historical average
12	BV/share	$> 10\%$ CAGR
13	Dividend growth	$> 8\%$ CAGR; payout $< 60\%$
14	Economic moat	At least one durable moat
15	Current ratio	≥ 1.5
16	Debt/EBITDA	$< 2.0\times$
17	Interest coverage	$\geq 8\times$
18	DSCR	$\geq 1.5\times$
19	Intrinsic value	20-30% discount
20	Technical strategy	Qualifying setup

4.2 Screening Rule

A company becomes a **Green Zone Candidate** when:

Primary requirement

$\geq 18/20$ criteria pass

Mandatory requirements

It must also satisfy the specified:

- Balance-sheet requirements
- Margin-of-safety requirement
- Technical confirmation requirement

This is important:

18/20 is not automatically sufficient if a critical risk-control criterion fails.

PART 5 — Special Valuation Screens

The system should run additional sector-specific screens.

Banks

Scan:

- P/B <1.0
- P/B <1.2

Insurance

Same:

- P/B <1.0
- P/B <1.2

Real Estate

Scan:

- P/B
- NAV-related metrics where applicable

Commodities

Use appropriate asset/earnings-cycle valuation rather than blindly applying growth-stock multiples.

Forward Valuation

Screen:

- Forward P/E
- Forward EV/EBITDA
- Forward FCF
- EPS estimates

Growth Expectations

Capture:

- 3-year EPS CAGR
- 5-year EPS CAGR
- Revenue estimates
- Earnings revisions

PART 6 — Stage 2: Institutional Equity Research

Every stock that survives the Green Zone screen moves into the **full research process**. This is where the 16-part institutional equity research template is applied.

6.1 Executive Summary

Produce:

- Investment rating
- Investment horizon
- Current valuation
- Margin of safety
- Key investment drivers
- Major risks

6.2 Business Overview

Analyse:

- Business model
- Revenue segments
- Geography
- Industry position
- Capital allocation

6.3 Financial Quality

Revenue

- Multi-year growth
- CAGR
- Consistency

Earnings

- Net income
- EPS
- Earnings quality

Cash Flow

- OCF
- FCF
- Cash conversion
- Capex requirements

6.4 Profitability

Analyse:

- Gross margin
- Operating margin
- Net margin
- Trends
- Industry comparison

6.5 Return on Capital

Analyse:

- ROE
- ROIC
- ROA
- Cost of capital

Core question:

Is the company generating returns above its cost of capital?

6.6 Balance Sheet

Analyse:

- Current ratio
- Quick ratio
- Debt/EBITDA
- Net debt
- Interest coverage
- Debt-service capacity
- Credit risk

6.7 Accounting Quality

Investigate:

- Revenue vs receivables
- Inventory
- Cash conversion
- Accruals
- Earnings manipulation risk
- Stock-based compensation
- Share dilution
- Buybacks
- Insider ownership

6.8 Per-Share Value Creation

Track:

- EPS
- BVPS
- FCF/share
- DPS
- Share count

The system should focus on **per-share economics**, not merely corporate growth.

6.9 Economic Moat

Assess:

- Brand
- Pricing power
- Network effects
- Switching costs

- Economies of scale
- Cost advantage
- Patents/IP
- Regulation
- Distribution

Rating

Wide / Narrow / None

6.10 Growth Drivers

Analyse:

- Organic growth
- Industry tailwinds
- AI/digital transformation
- International expansion
- New products
- M&A
- Management execution

6.11 Valuation

Use multiple valuation methodologies:

Intrinsic

- DCF
- Reverse DCF
- Rule #1 valuation

Relative

- EV/EBITDA
- Forward P/E
- P/FCF
- PEG
- P/B

SOTP

Where applicable.

Every valuation must separate:

FACT from **ASSUMPTION** from **SENSITIVITY**

6.12 Technical Analysis

Analyse:

- Long-term trend
- Support
- Resistance
- Moving averages
- RSI
- Volume
- Volume profile
- Risk/reward

6.13 Risk Analysis

Classify:

- Business
- Financial
- Industry
- Regulatory
- Competitive
- Currency
- Geopolitical
- Valuation

Each risk receives: **Probability × Impact**

6.14 Scenario Analysis

Bull

- Assumptions
- Fair value
- Upside

Base

- Most likely assumptions
- Fair value

Bear

- Downside assumptions
- Fair value
- Downside

6.15 Investment Thesis

Answer:

Why should this stock outperform?

Then identify:

- Mispricing
- Catalysts
- Competitive advantages
- Growth drivers
- Thesis invalidation conditions

6.16 Final Scorecard

Category	Score
Revenue Growth	/10
Profitability	/10
Cash Flow	/10
ROE & ROIC	/10
Balance Sheet	/10
Economic Moat	/10
Management	/10
Valuation	/10
Technical Setup	/10

Category	Score
Risk	/10
Total	/100

Interpretation

Score	Interpretation
90-100	Exceptional compounder
80-89	High-quality investment
70-79	Attractive with risks
60-69	Fair/mixed
<60	Caution

PART 7 — Rule #1 Engine

The Rule #1 analysis runs **parallel to the institutional research**, not instead of it.

Four Ms

Meaning

Understandable and economically durable business.

Moat

Durable competitive advantage.

Management

Quality and shareholder alignment.

Margin of Safety

Intrinsic value versus market price.

Five Numbers

The Rule #1 Agent explicitly tests:

1. Revenue growth >10%
2. EPS growth >10%
3. Equity growth >10%
4. FCF growth >10%
5. ROIC >15%

Rule #1 Valuation

Calculate:

Sticker Price

Intrinsic value.

Margin of Safety

$$MOS = \frac{Intrinsic\ Value - Price}{Intrinsic\ Value}$$

Buy Price

Apply the required safety discount.

This creates a second valuation perspective that can be compared against the institutional DCF.

PART 8 — Stage 3: Quantitative Analysis

The Quant layer asks:

Does the historical/statistical evidence support the thesis?

Analyse:

- Momentum
- Value
- Quality
- Growth
- Volatility
- Size
- Earnings revisions
- FCF yield
- ROIC
- Factor exposure
- Beta
- Correlation
- Sharpe
- Sortino
- Drawdown

Also perform:

- Event studies
- Historical earnings analysis
- Macro-event analysis
- Backtesting
- Walk-forward testing
- Monte Carlo simulation

PART 9 — Stage 4: Macro Regime Analysis

The Macro layer determines the environment in which the stock is operating.

Economic Regime

Classify:

- Recovery
- Expansion
- Slowdown
- Recession

Market Regime

Classify:

- Risk-on
- Neutral
- Risk-off

Sector Rotation

Economic Phase	Favoured
Early expansion	Technology, Discretionary, Industrials
Mid expansion	Financials, Materials, Energy
Late expansion	Energy, Materials, Industrials
Recession	Staples, Utilities, Healthcare

Monitor:

- GDP
- PMI
- Employment
- CPI
- PPI
- Consumer confidence
- Yield curve

PART 10 — Stage 5: Technical Entry Engine

Technical analysis should **not decide whether a company is fundamentally good**.

It determines:

When to enter, where to enter and how much risk is being taken.

There are two primary strategies.

10.1 Mean Reversion

Primary triggers

3-Day: RSI(10) <30

Weekly: RSI(10) <30

Confirmations

- CMI(21) <0
- Williams %R(13) <-80
- Williams %R(52) <-80
- Major support
- Bullish reversal
- Candlestick pattern
- Volume

Rule

RSI must align with **CMI + Williams %R**

10.2 Trend Following

Primary triggers

- Daily Aroon(25) >100
- Weekly Aroon(25) >100
- Trendline breakout

Confirmations

- ADX
- MACD
- Ichimoku
- Chart pattern
- Volume

The original framework specifies ADX <20 as confirmation; this should be preserved in the system specification, but the quantitative engine should separately flag that this threshold is unconventional for trend-strength confirmation rather than silently changing the rule.

PART 11 — Market Timing Overlay

Market conditions influence position aggressiveness.

Fear & Greed

Index	Action
0-25	Accumulation
25-45	Cautious accumulation
45-65	Neutral
65-80	Reduce
80-100	Aggressive risk reduction

VIX

VIX	Action
<15	Normal
15-20	Tighten risk
20-30	Reduce position size
>30	Risk-off

These should be treated as **portfolio overlays**, not standalone buy/sell signals.

PART 12 — Sheet 2: Volatility & ATR Risk Engine

This is the missing bridge between **technical entry** and **actual position sizing**.

ATR answers:

How much does this stock normally move?

The risk engine answers:

Given that volatility, how large should the position be?

12.1 ATR

Average True Range measures typical price movement.

The system should calculate ATR for appropriate timeframes and use it to establish:

- Stop distance
- Volatility-adjusted entry
- Position size
- Target
- Expected movement
- Risk/reward

12.2 ATR-Based Stop

Instead of saying:

“Use a 7% stop on every stock.”

the system can determine:

$$StopDistance = ATR \times ATRMultiplier$$

Then:

$$StopPrice = EntryPrice - StopDistance$$

for a long position.

This is superior to applying an identical percentage stop to stocks with radically different volatility profiles.

12.3 ATR-Based Position Sizing

The fundamental risk equation is:

$$PositionSize = \frac{AccountRisk}{RiskPerShare}$$

where:

$$RiskPerShare = Entry - Stop$$

Therefore:

$$PositionSize = \frac{AccountValue \times Risk\%}{Entry - Stop}$$

ATR determines the stop distance.

12.4 ATR-Based Risk/Reward

For a long:

$$\frac{R}{R} = \frac{Target - Entry}{Entry - Stop}$$

The system should reject trades where the expected reward does not compensate adequately for volatility-adjusted risk.

PART 13 — Options Intelligence

The Options Agent sits between market analysis and portfolio/risk management.

It evaluates whether the same investment thesis can be expressed more efficiently through:

- Stock
- Covered call
- Cash-secured put
- Call spread
- Put spread
- Protective put
- Collar

It must analyse:

- IV
- IV Rank
- IV Percentile

- Historical volatility
- Expected move
- Skew
- Open interest
- Earnings risk

PART 14 — Risk Management Engine

This is the **hard-control layer**.

The system should never permit a trade simply because the CIO says BUY.

14.1 Trading Risk

Parameter	Rule
Max capital/trade	20%
Risk/trade	1-2%
Stop	5-8% framework
R/R	1.5:1-3:1
Daily loss	3%
Weekly loss	6%

14.2 Position Investment Risk

Parameter	Rule
Position allocation	10-15%
Risk/position	2-3%
Stop	10-15%
Target R/R	2:1-4:1
Portfolio drawdown	15%
Position drawdown	20%

PART 15 — Portfolio Risk Limits

The portfolio-level system imposes:

Maximum drawdown

15%

Sector concentration

≤25%

Single stock

≤10%

Minimum sectors

5

Correlation

Maximum **30% correlated exposure** under the original framework.

However, the system should also use the correlation matrix and factor analysis to detect hidden concentration.

PART 16 — Risk Manager Agent

The Risk Manager becomes the **independent gatekeeper**.

Before approval:

Fundamental PASS?
Rule #1 PASS?
Valuation PASS?
Technical PASS?
ATR Risk PASS?
Position Size PASS?
R/R PASS?
Sector PASS?
Correlation PASS?
Liquidity PASS?
Drawdown PASS?
Macro PASS?

If a hard risk limit fails:

TRADE BLOCKED

The Risk Agent should have **veto authority** over risk-limit violations.

PART 17 — Portfolio Manager Agent

The Portfolio Manager asks a different question:

“Even if this is a good investment, is it the best use of our capital right now?”

Responsibilities:

- Portfolio construction
- Asset allocation
- Capital allocation
- Opportunity cost
- Rebalancing
- Diversification
- Liquidity
- Sector exposure
- Portfolio optimization

PART 18 — Capital Allocation Engine

Every candidate is compared with existing holdings.

For example:

A stock should enter the portfolio because it is:

better than the marginal existing investment on a risk-adjusted basis.

PART 19 — CIO Agent

The CIO is the **final analytical synthesizer**.

It receives:

Fundamental
Rule #1
Quant
Technical
Macro
Options
Risk
Portfolio

and produces:

Investment Rating

- Strong Buy
- Buy
- Hold
- Sell

Confidence

0-100

Expected Return

Downside

Margin of Safety

Risk/Reward

Investment Horizon

Catalysts

Risks

Thesis Kill Conditions

PART 20 — CIO Confidence Model

Confidence should depend on:

1. Agent agreement
2. Evidence quality
3. Data freshness
4. Model uncertainty
5. Valuation sensitivity
6. Contradictions
7. Risk assessment

The system should distinguish:

Confidence in analysis

from:

Probability of positive return.

PART 21 — Agent Conflict Resolution

The agents should **not operate as a democratic voting system.**

Example:

Fundamental	BUY
Rule #1	BUY
Quant	BUY
Technical	SELL
Macro	NEUTRAL
Options	BEARISH
Risk	BLOCK

Correct outcome:

NO TRADE

because the Risk Manager has identified a hard constraint.

The CIO should instead state:

The investment thesis remains attractive, but the current trade is prohibited until the risk condition is resolved.

This distinction between **investment thesis** and **trade eligibility** is fundamental.

PART 22 — Final Investment Decision Tree

The complete decision logic becomes:

PART 23 — Entry Rule

A stock becomes **TRADE-ELIGIBLE** only when:

Fundamental

Green Zone $\geq 18/20$

Valuation

20–30%+ margin of safety

Rule #1

Four Ms and Five Numbers acceptable

Technical

Mean-reversion **OR** trend-following setup confirmed

Market

Fear & Greed and VIX within acceptable parameters

Risk

ATR-adjusted risk acceptable

Portfolio

Sector, correlation and position limits acceptable

CIO

Positive recommendation with sufficient confidence

Human

Approval obtained

PART 24 — Exit Engine

Exits operate on several independent triggers.

Fundamental Exit

Green Zone criteria deteriorate materially.

Valuation Exit

Price reaches or materially exceeds intrinsic value.

Technical Exit

- Mean reversion: RSI reaches overbought conditions
- Trend reversal
- Aroon deterioration
- Major support breakdown

Risk Exit

- Stop hit
- Position risk becomes excessive
- Portfolio drawdown breach

Market Exit

VIX >30 or severe market regime deterioration.

Thesis Exit

The fundamental reason for owning the stock has been invalidated.

This is more important than simply using a mechanical stop.

PART 25 — Monitoring Engine

After investment, the system does not stop.

It continuously monitors:

Company

- Earnings
- Revenue
- Margins
- FCF
- Guidance
- Debt
- Management

Valuation

- Current price
- Fair value
- MOS

Technical

- Trend
- RSI
- Volume
- ATR

Macro

- Rates
- Inflation
- PMI
- Employment
- VIX

Portfolio

- Weight
- Correlation
- Sector exposure
- Drawdown

PART 26 — AI Multi-Agent Architecture

Now the AI architecture fits naturally into the investment process.

Research Agents

1. Fundamental Analyst

Business and financial quality.

2. Rule #1 Agent

Four Ms, Five Numbers, Sticker Price.

3. Technical Analyst

Timing, trend and momentum.

4. Quant Agent

Statistics, factors and backtesting.

5. Macro Agent

Economic and market regimes.

6. Options Agent

Volatility, income and hedging.

Control Agent

7. Risk Manager

Risk limits, ATR, position sizing, stress testing and exposure.

Capital Agent

8. Portfolio Manager

Construction and capital allocation.

Executive Agent

9. CIO

Synthesis, recommendation and confidence.

Execution Agent

10. Trade Execution

Phase 2.

PART 27 — Agent Responsibility Matrix

Agent	Primary Question
Fundamental	Is this a good business?
Rule #1	Is it a wonderful business at a wonderful price?
Quant	Does the statistical evidence support it?
Technical	When should we enter/exit?
Macro	Is the environment supportive?
Options	Is there a superior options expression?

Agent	Primary Question
Risk	Can we safely take this risk?
Portfolio Manager	Is this the best use of capital?
CIO	What should we ultimately recommend?
Execution	How should the approved trade be executed?

This is the key conceptual structure.

PART 28 — Agent Output Standard

Every agent should produce a standardized output.

TICKER

AGENT

DATE

DATA QUALITY

RECOMMENDATION

SCORE

CONFIDENCE

KEY EVIDENCE

PASS CRITERIA

FAIL CRITERIA

KEY RISKS

CONTRADICTIONS

ASSUMPTIONS

DATA GAPS

REQUIRED FOLLOW-UP

FINAL AGENT CONCLUSION

This allows the CIO to systematically compare agents.

PART 29 — Human-in-the-Loop Governance

The AI should be a **decision-support system**, not an uncontrolled autonomous investment manager.

The hierarchy should be:

Phase 2 can introduce automated execution subject to hard-coded controls.

PART 30 — Phase 2 Execution Architecture

The Trade Execution Agent connects to at least two brokers.

Potential architecture:

It manages:

- Order creation
- Order routing
- Order status
- Fills
- Slippage
- Partial fills
- Rejections
- Execution quality

PART 31 — Backtesting and Research Sandbox

Before deployment, every strategy should be tested.

Required methodology

1. Historical backtest
2. Out-of-sample testing
3. Walk-forward analysis
4. Monte Carlo simulation
5. Transaction-cost modelling
6. Slippage modelling
7. Liquidity constraints
8. Regime analysis
9. Stress testing

Most importantly:

No look-ahead bias.

PART 32 — Performance Feedback Loop

The system should learn from its own decisions.

```
SIGNAL
↓
DECISION
↓
TRADE
↓
OUTCOME
↓
ATTRIBUTION
↓
WHAT WORKED?
↓
WHAT FAILED?
↓
MODEL UPDATE
↓
BACKTEST
↓
PRODUCTION
```

Track:

- Prediction accuracy
- Agent accuracy
- CIO accuracy
- Win rate
- Expected vs realized return
- Expected vs realized volatility
- Expected vs realized drawdown
- Slippage
- False positives
- False negatives

PART 33 — Investment Decision Record

Every investment should generate a permanent investment record.

Example

TICKER: NVDA

DATE: XX/XX/XXXX

GREEN ZONE: 19/20

FUNDAMENTAL: 92/100

RULE #1: PASS

QUANT: 87/100

MACRO: 78/100

TECHNICAL: 84/100

OPTIONS: 81/100

INTRINSIC VALUE: \$XXX

CURRENT PRICE: \$XXX

MARGIN OF SAFETY: XX%

ATR: XX

ENTRY: \$XXX
STOP: \$XXX
TARGET: \$XXX

RISK/REWARD: X.X:1

POSITION SIZE: X%

CIO RATING: BUY
CIO CONFIDENCE: XX%

RISK MANAGER: PASS

PORTFOLIO MANAGER: APPROVED

HUMAN DECISION: APPROVED

This becomes the audit trail for every decision.

PART 34 — The Final ChoreData Investment Engine

The entire framework can ultimately be reduced to **10 investment questions**:

Question 1

Is the company financially excellent?

→ Institutional Research

Question 2

Does it have a durable competitive advantage?

→ Moat Analysis

Question 3

Does it pass the Rule #1 framework?

→ Four Ms + Five Numbers

Question 4

Is the valuation attractive?

→ DCF + Reverse DCF + Relative Valuation + Sticker Price

Question 5

Does statistical evidence support the thesis?

→ Quant

Question 6

Is the macro environment supportive?

→ Macro

Question 7

Is the technical setup favourable?

→ Technical

Question 8

How much capital should we risk?

→ ATR + Risk Manager

Question 9

Is this the best use of portfolio capital?

→ Portfolio Manager

Question 10

Should we actually make the investment?

→ CIO + Human Approval

PART 35 — Master Operating Model

The final ChoreData system therefore becomes:

The Fundamental Logic

The framework is therefore **not simply a stock screener**.

It is a complete:

Research → Valuation → Timing → Risk → Allocation → Execution → Monitoring → Learning
system.

And the most important separation is:

**A good company ≠ a good investment. A good investment ≠ a good trade today.
A good trade ≠ an appropriately sized trade. A good trade ≠ a good portfolio
allocation.**

The ChoreData architecture is designed to answer those four questions sequentially.

That is the proper conceptual foundation for building the **Vianomics AI Investment Intelligence Platform (VAIIP)**.
